

G14671 to G14674-0808W

Image sensor with 320 × 256 pixels developed for two-dimensional infrared imaging

The G14671 to G14674-0808W have a hybrid structure consisting of a CMOS readout circuit (ROIC: readout integrated circuit) and back-illuminated InGaAs photodiodes. Each pixel is made up of an InGaAs photodiode and a ROIC electrically connected by indium bump. The timing generator in the ROIC provides an analog video output which is obtained by just supplying digital inputs.

The G14671 to G14674-0808W have 320 × 256 pixels arrayed at a 20 μm pitch. Light incident on the InGaAs photodiodes is converted into electrical signals which are then input to the ROIC through indium bumps. Electrical signals in the ROIC are converted into voltage signals and then sequentially output from the video line by the shift register. The G14671 to G14674-0808W are hermetically sealed in a metal package together with a two-stage thermoelectric cooler to deliver stable operation. The frame rate is more than twice that of the previous product, and a partial readout function has been added.

Features

- High sensitivity: 3.5 μV/e⁻
- Frame rate: 509 fps max.
[4 ports, all pixels (320 × 256) readout, minimum integration time=1 μs]
- Low dark current
- Global shutter mode
- Partial readout function
- Single operation (built-in timing generator)
- Two-stage TE-cooled type

Applications

- Near infrared non-destructive inspection
(farm produce inspection, semiconductor inspection, fill level inspection)
- Hyperspectral imaging
- Traffic monitoring

Selection guide

Type no.	Spectral response range (μm)
G14671-0808W	0.95 to 1.69 (15 °C)
G14672-0808W	1.12 to 1.85 (-20 °C)
G14673-0808W	1.3 to 2.15 (-20 °C)
G14674-0808W	1.7 to 2.55 (-20 °C)

Structure

Parameter	Specification	Unit
Image size	6.40 × 5.12	mm
Cooling	Two-stage TE-cooled	-
Total number of pixels	320 × 256 (81920)	pixels
Number of effective pixels	320 × 256 (81920)	pixels
Pixel size	20 × 20	μm
Pixel pitch	20	μm
Fill factor	100	%
Package	28-pin metal (refer to dimensional outline)	-
Window material	Sapphire glass with anti-reflective coating	-

Block diagram

The series of operations of the readout circuit are described below.

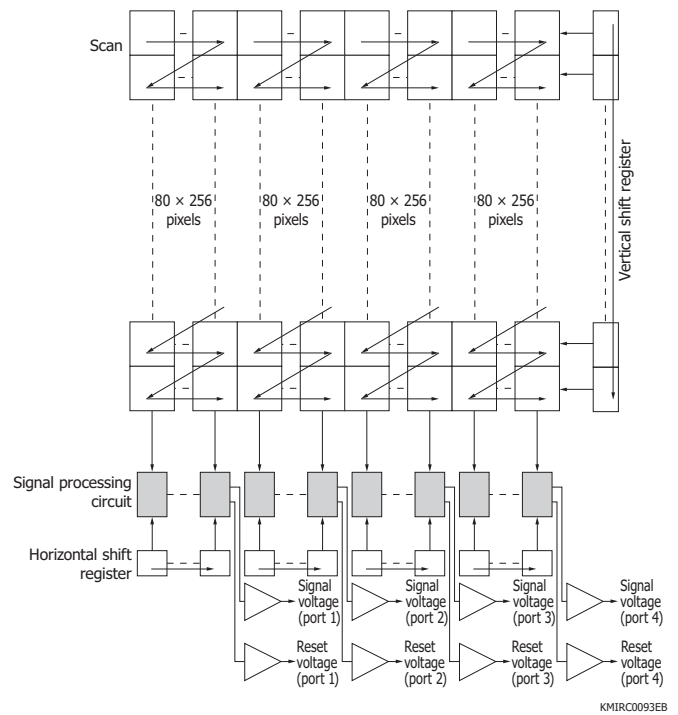

The integration time is equal to the low period of the master start pulse (MSP), which is a frame scan signal, and the output voltage is sampled and held simultaneously at all pixels. Then, the pixels are scanned, and the video is output.

The vertical shift register scans from top to bottom while sequentially selecting each row. The following operations ① to ③ are performed on each pixel of the selected row.

- ① Transfers the optical signal information sampled and held in each pixel to the signal processing circuit as a signal voltage, and samples and holds the signal voltage.
- ② Resets each pixel after having transferred the signal, transfers the reset signal voltage to the signal processing circuit, and samples and holds the reset signal voltage.
- ③ The horizontal shift register performs a sequential scan to output the signal voltage and reset signal voltage as serial data. The offset voltage in each pixel can be eliminated by finding a difference between the signal voltage and the reset signal voltage with a circuit outside the sensor.

Then the vertical shift register shifts by one row to select the next row and the operations ① to ③ are repeated.

When the MSP, which is a frame scan signal, goes low after the vertical shift register advances to the 256th row, the reset switches for all pixels simultaneously turn off and the next frame integration begins.

Absolute maximum ratings

Parameter	Symbol	Condition	Value	Unit
Supply voltage (5 V)	Vdd, DVdd V(PD_bias), V(INP) Vb1	Ta=25 °C	-0.3 to +6.0	V
Supply voltage (3.3 V)	Vdd(3.3 V) DVdd (3.3 V)	Ta=25 °C	-0.3 to +4.2	V
Input signal voltage	V(MCLK), V(MSP) V(Vdd), V(En_add) V(Port_sel), V(Mode)	Ta=25 °C	-0.3 to +4.2	V
Operating temperature*1 *2	Topr		-30 to +60	°C
Storage temperature*2	Tstg		-40 to +70	°C
Allowable current of TE-cooler	Ic		2.8	A
Allowable voltage of TE-cooler	Vc		4.0	V
Thermistor power dissipation	Pth		400	mW

*1: Chip temperature

*2: No dew condensation

When there is a temperature difference between a product and the ambient in high humidity environment, dew condensation may occur on the product surface. Dew condensation on the product may cause a deterioration of characteristics and reliability.

Note: Exceeding the absolute maximum ratings even momentarily may cause a drop in product quality. Always be sure to use the product within the absolute maximum ratings.

Electrical and optical characteristics [Ta=25 °C, Vdd=5 V, Vdd(3.3 V)=Port_sel=Mode=3.3 V, Vb1=0.83 V, PD_bias=4.28 V, INP=4.2 V]

Timing chart

The video output from a single pixel is equal to 4 MCLK (master clock) pulses. The MSP (master start pulse) is a signal for setting the integration time, so making the low (0 V) period of the MSP longer will extend the integration time. The MSP also functions as a signal that triggers each control signal to perform frame scan. When the MSP goes from low (0 V) to high (5 V), each control signal starts on the falling edge of the MCLK and frame scan is performed during the high period of the MSP. The low (0 V) period of the MSP serves as the integration time.

- Number of readout ports: 4 ports [Port_sel (24-pin): High (3.3 V)]

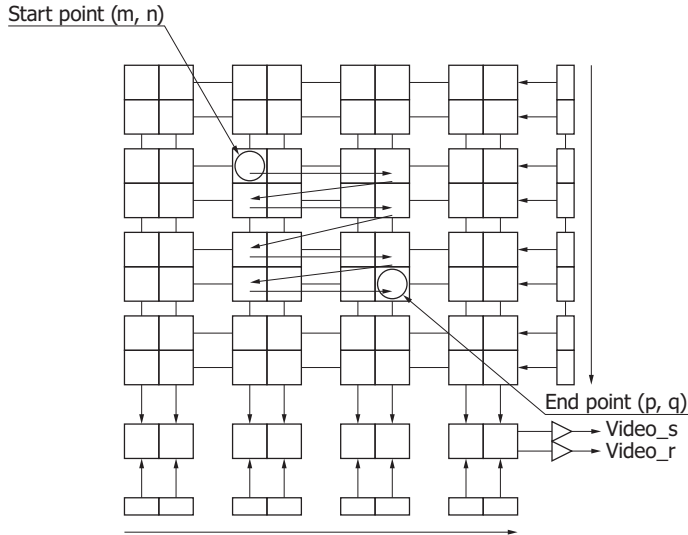

KMIRC0131EA

- Number of readout ports: 1 port [Port_sel (24-pin): Low (0 V)]
 Partial readout

The G14671 to G14674-0808W series have the partial readout function. The number of readout region is one per frame. Specify the readout region in coordinate with a start coordinate (m, n) and end coordinate (p, q). When there is a small number of readout pixels, the frame rate is higher.

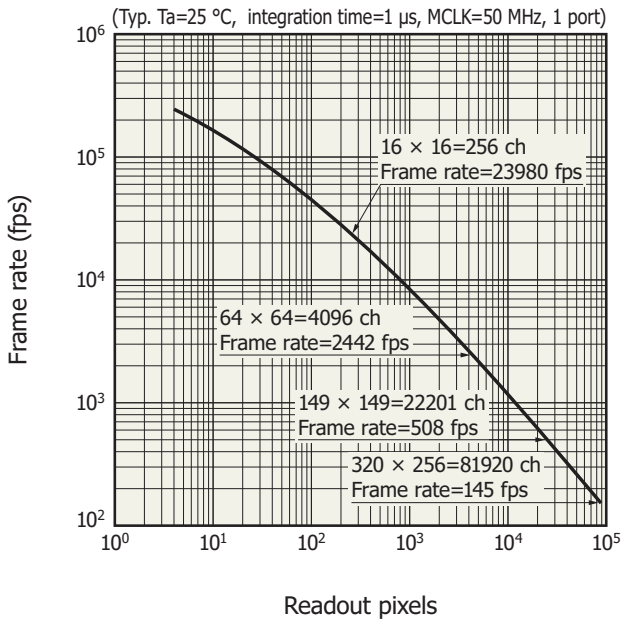

- Readout region (m, n) to (p, q)

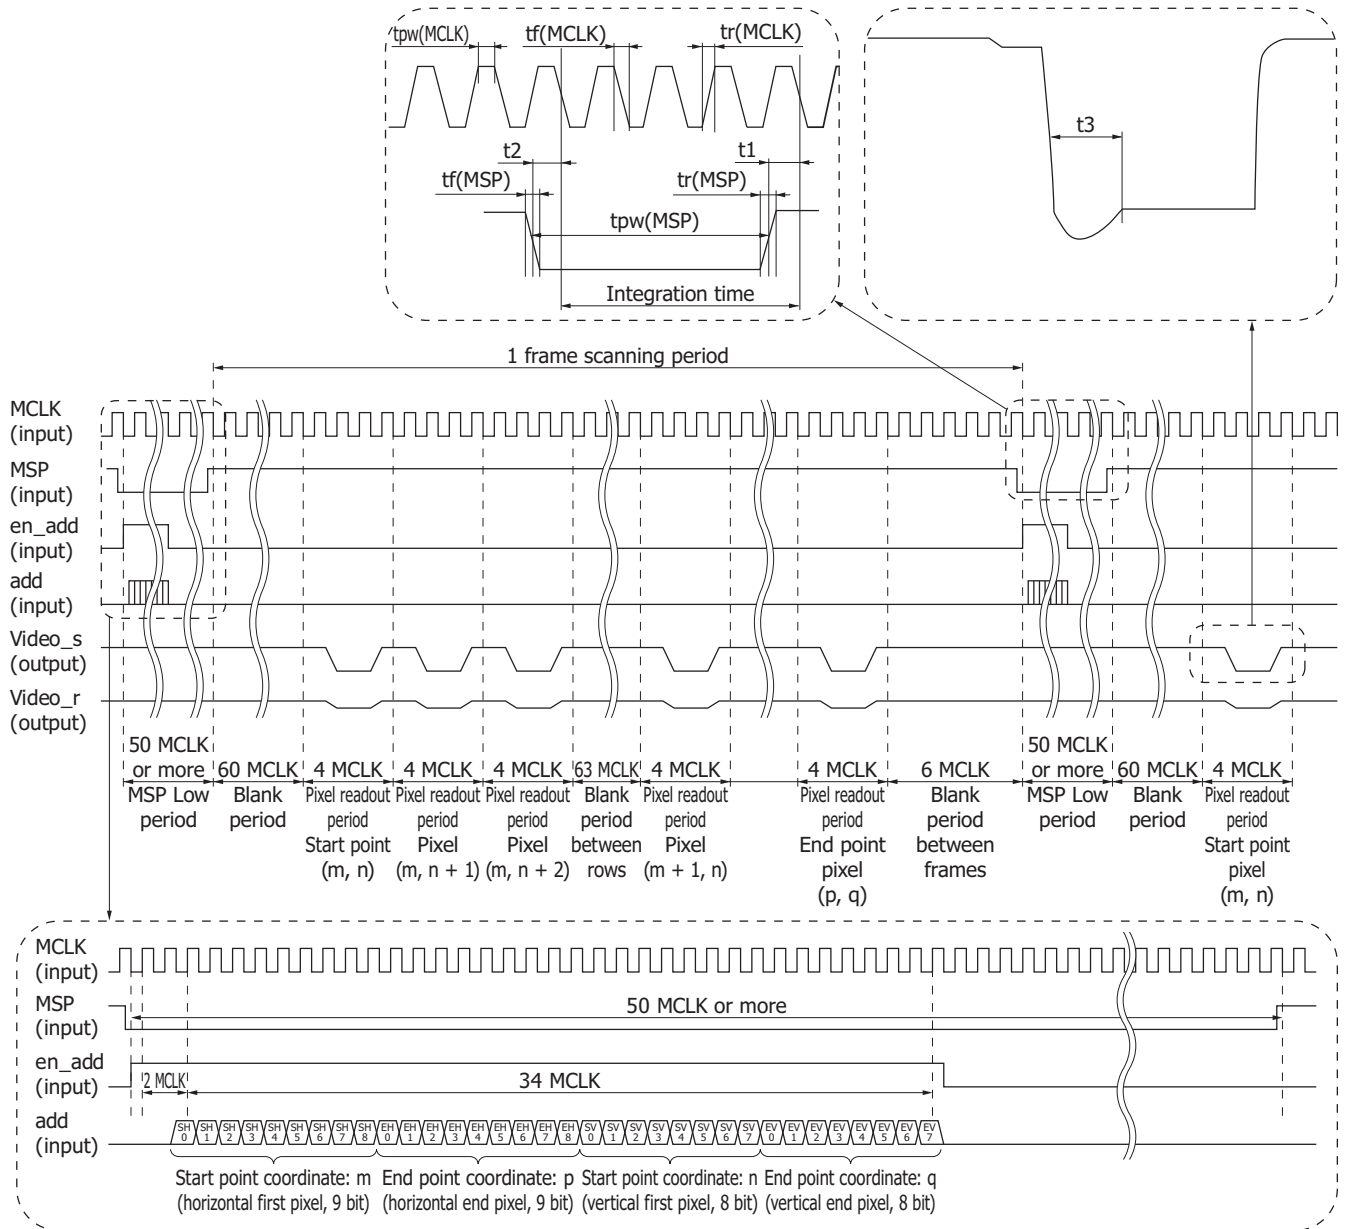

KMIRC0128EA

The following figure shows the relationship between the frame rate and the number of readout pixels for 1 port. The frame rate, with 1 port and 149 × 149 pixels readout, corresponds to the frame rate with 4 ports and all-pixel readout.

- Frame rate vs. number of readout pixels

Specifications of built-in TE-cooler and thermistor

Parameter	Symbol	Condition	Min.	Typ.	Max.	Unit
Internal resistance	Rint	Ta=25 °C	0.75	0.9	1.05	Ω
Maximum heat absorption of built-in TE-cooler*12 *13	Qmax		-	8.4	-	W
Thermistor resistance	Rth		9	10	11	kΩ

*12: This is a theoretical heat absorption level that offsets the temperature difference in the thermoelectric cooler when the maximum current is supplied to the sensor.

*13: Heat absorption at Tc=Th

Tc: Temperature on the cooling side of TE-cooler

Th: Temperature on the heat dissipating side of TE-cooler.

Thermistor temperature characteristics

KMIRB0116EA

Cooling characteristics of TE-cooler

KMIRB0117EA

There is the following relation between the thermistor resistance and temperature (°C).

$$R1 = R2 \times \exp B \{1/(T1 + 273.15) - 1/(T2 + 273.15)\}$$

R1: resistance at T1 (°C)

R2: resistance at T2 (°C)

B: B constant (B=3950 K ± 2%)

Thermistor resistance=10 kΩ (at 25 °C)

Precautions

(1) Electrostatic countermeasures

This device has a built-in protection circuit against static electrical charges. However, to prevent destroying the device with electrostatic charges, take countermeasures such as grounding yourself, the workbench and tools to prevent static discharges. Also protect this device from surge voltages which might be caused by peripheral equipment.

(2) Incident window

If there is dust or stain on the light incident window, it will show up as black blemishes on the image. When cleaning, avoid rubbing the window surface with dry cloth, dry cotton swab or the like, since doing so may generate static electricity. Use soft cloth, paper or a cotton swab moistened with alcohol to wipe dust and stain off the window surface. Then blow compressed air onto the window surface so that no spot or stain remains.

(3) Soldering

To prevent damaging the device during soldering, take precautions to prevent excessive soldering temperatures and times. Soldering should be performed within 10 seconds at a soldering temperature below 260 °C.

(4) Operating and storage environments

Handle the device within the temperature range specified in the absolute maximum ratings. Operating or storing the device at an excessively high temperature and humidity may cause variations in performance characteristics and must be avoided.
