

S12071

High sensitivity in UV region, anti-blooming function included

The S12071 CCD area image sensor has a back-thinned structure that enables a high sensitivity in the UV to visible region as well as a wide dynamic range, low dark current, and an anti-blooming function. A dedicated driver circuit C12081 series (with Camera Link and USB 2.0 interfaces) is also provided (sold separately).

Features

- High sensitivity in UV region
- One-stage TE-cooled type
- Low dark current
- Anti-blooming function included
- Selectable readout port to match your application
tap A: low noise amplifier (1 MHz max.)
tap B: high-speed amplifier (10 MHz max.)
- Number of effective pixels: 1024 × 1024

Applications

- ICP spectrophotometry
- Scientific measuring instrument
- UV imaging

Structure

Parameter		Specification
Image size (H × V)		24.576 × 24.576 mm
Pixel size (H × V)		24 × 24 μm
Number of total pixels (H × V)		1056 × 1032
Number of effective pixels (H × V)		1024 × 1024
Vertical clock phase		2 phases
Horizontal clock phase		2 phases
Output circuit	Tap A	One-stage MOSFET source follower
	Tap B	Three-stage MOSFET source follower
Package		40-pin ceramic DIP
Window		Quartz
Cooling		One-stage TE-cooled

*1: Chip temperature

*2: No dew condensation

When there is a temperature difference between a product and the surrounding area in high humidity environment, dew condensation may occur on the product surface. Dew condensation on the product may cause deterioration in characteristics and reliability.

*3: If the current greater than this value flows into the thermoelectric cooler, the heat absorption begins to decrease due to the Joule heat. It should be noted that this value is not the damage threshold value. To protect the thermoelectric cooler and maintain stable operation, the supply current should be less than 60% of this maximum current.

Note: Exceeding the absolute maximum ratings even momentarily may cause a drop in product quality. Always be sure to use the product within the absolute maximum ratings.

When there is a temperature difference between a product and the ambient in high humidity environment, dew condensation may occur on the product surface. Dew condensation on the product may cause a deterioration of characteristics and reliability.

▣ Device structure (conceptual drawing of top view)

Note: When viewed from the direction of the incident light, the horizontal shift register is covered with a thick silicon layer (dead layer). However, long-wavelength light passes through the silicon dead layer and may possibly be detected by the horizontal shift register. To prevent this, provide light shield on that area as needed.

Dimensional outline (unit: mm)

*1: Never push the aluminum frame when inserting the sensor into the printed circuit board or the like. Pressing the aluminum frame may cause the window material to peel off and air tightness to be compromised. When inserting the sensor, hold its sides. The sensor can also be inserted by pushing the screw fixing parts at the ends of the package, but do not push with excessive force as they may break.

*2: There is a deflection in the photosensitive area [PV (peak to valley) value: approx. 80 to 160 μm].

Specifications of built-in TE-cooler (Typ. vacuum condition)

Parameter	Symbol	Condition	Specification	Unit
Internal resistance	Rint	Ta=25 °C	0.65 ± 0.13	Ω
Maximum heat absorption of built-in TE-cooler*19 *20	Qmax		9.9	W

*19: This is a theoretical heat absorption level that offsets the temperature difference in the thermoelectric cooler when the maximum current is supplied to the sensor.

*20: Heat absorption at Tc=Th

Tc: Temperature on the cooling side of TE-cooler

Th: Temperature on the heat dissipating side of TE-cooler.

KMPD80371EA

To make the cooling side 0 °C, the temperature on the heat dissipating side must be 30 °C or less. As a guideline, use a heatsink whose thermal resistance is no more than 1 °C/W.

Specifications of built-in temperature sensor

A thermistor chip is built in the same package with a CCD chip, and the CCD chip temperature can be monitored with it. A relation between the thermistor resistance and absolute temperature is expressed by the following equation.

$$R_{T1} = R_{T2} \times \exp \frac{B(T1/T2) (1/T1 - 1/T2)}$$

R_{T1}: Resistance at absolute temperature T1 [K]

R_{T2}: Resistance at absolute temperature T2 [K]

B_{T1/T2}: B constant [K]

The characteristics of the thermistor used are as follows.

R₂₉₈=10 kΩ

B_{298/323}=3450 K

KMPD801113B

Precautions (electrostatic countermeasures)

- Handle these sensors with bare hands or wearing cotton gloves. In addition, wear anti-static clothing or use a wrist band with an earth ring, in order to prevent electrostatic damage due to electrical charges from friction.
- Avoid directly placing these sensors on a work-desk or work-bench that may carry an electrostatic charge.
- Provide ground lines or ground connection with the work-floor, work-desk and work-bench to allow static electricity to discharge.
- Ground the tools used to handle these sensors, such as tweezers and soldering irons.

It is not always necessary to provide all the electrostatic measures stated above. Implement these measures according to the amount of damage that occurs.

Element cooling/heating temperature incline rate

When cooling the CCD by an externally attached cooler, set the cooler operation so that the temperature gradient (rate of temperature change) for cooling or allowing the CCD to warm back is less than 5 K/minute.
